

Medical Professionals

Because of the effects throughout the body, for optimal outcomes, many different specialties should participate in the care of people with achondroplasia. Consider talking with your doctor to help you assemble a care team that includes medical and other health professionals.

Medical geneticist

May be involved in the achondroplasia diagnosis and provide ongoing care, including genetic and family planning guidance

Pediatrician or primary care doctor

Performs regular checkups and monitors developmental milestones. Your child's primary care doctor may also refer you to a **pediatric endocrinologist**, who may help monitor the growth of your child

Neurosurgeon

Monitors for complications like fluid on the brain or pressure on the brain stem or spinal cord and, if necessary, performs surgery to correct them

Ear, nose, and throat (ENT) specialist

May insert tubes to prevent chronic ear infections or remove the tonsils and/or adenoids to help with sleep apnea

Sleep specialist

A medical doctor who has completed additional education and training in the field of sleep medicine and can help monitor for and manage sleep apnea

Pulmonologist

Addresses any breathing problems, especially in infancy

Ophthalmologist

Treats problems with the eyes, like blurred vision or eye misalignment (such as crossed, drifting, or wandering eyes), which can happen because of the way the bones develop

Orthodontist

Treats problems with the teeth or mouth, like misaligned teeth, a narrow palate, open bite, or underbite

Orthopedic surgeon

Corrects bone problems that cause pain and affect mobility, including surgery if necessary

Psychologist or other mental health provider

Provides support and guidance for psychosocial and emotional issues

Cardiologist

Regularly monitors blood pressure and other risks for heart disease and addresses any heart-related issues

Occupational therapist

Helps improve physical strength and function for activities of daily living

Physical therapist

Helps increase mobility, align bones and joints, or lessen pain

Nutritionist or dietitian

Helps manage weight and avoid obesity through nutritional planning

Special Considerations When Having Surgery

It is important to work with a surgeon and anesthesiologist who have experience treating people with achondroplasia. This is because of the special considerations needed to reduce the risks of complications associated with airway management and other anatomical differences.

Psychosocial Support

- **Psychologist or other mental health provider** to provide support and guidance for psychosocial and emotional issues
- **Local chapters of advocacy groups** may offer support groups for families to connect with one another

Here are a few questions to consider asking healthcare providers to help you decide if they have the expertise you are looking for:

1

How many children with achondroplasia or other skeletal dysplasias have you treated?

2

Have you been involved in any research on achondroplasia?

3

What other types of doctors should my child be seeing?

4

How will you coordinate care with the rest of my child's healthcare team?
